Our algorithm extends and combines the techniques of Leven and Sharir and of Sifrony and Sharir used for the case in which  $B$  is a line segment (a ladder ). It also makes use of the results of Kedem and Sharir on the planning of translational motion of  $B$  amidst polygonal obstacles, and of a recent result of Leven and Sharir on the number of free critical contacts of  $B$  with such polygonal obstacles. 1. Introduction. Let  $B$  be a convex polygonal object having  $k$  vertices and edges, free to move (translate and rotate) in an open two-dimensional space  $V$  bounded by a collection of polygonal obstacles( walls ) having altogether  $n$  corners. The problem studied in this paper is to plan automatically a continuous obstacle avoiding motion of  $B$  between any two specified initial and final placements; cf. Fig. 1.1.
